

## Lighthouse

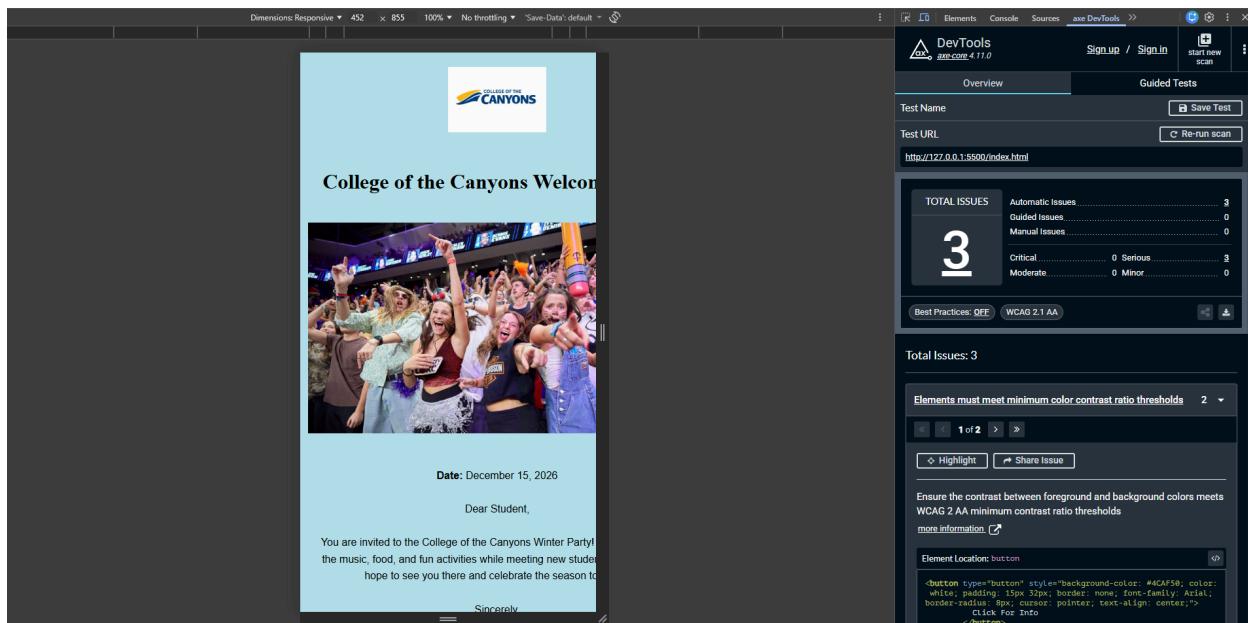

Pros ideas:

- Easy to use
- Gives quick scores
- Shows what problems your page has
- Helps find issues like contrast and missing alt text

Cons ideas:

- Not perfect for email HTML
- Does not catch every accessibility problem
- Some suggestions do not apply to all websites
- Scores can change sometimes

## Axe DevTools

### Pros

- Easy to use and fast.
- Tell you what is wrong on the page.
- Shows exactly where the problem is.
- Helps you fix things like contrast and missing labels.

### Cons

- Some parts cost money.
- Some messages are confusing.
- It does not catch every accessibility problem.
- It can sometimes show warnings that are not a big deal.

## Silktide

The screenshot shows the Silktide web application interface. On the left, there's a preview window displaying a landing page for the "College of the Canyons Welcome Event". The page features the college's logo at the top, followed by a large photo of a cheering crowd. Below the photo, the text "College of the Canyons Welcome Event" is centered. Underneath the event title, there's a date "December 15, 2026" and a greeting "Dear Student,". A block of text invites students to a winter party, mentioning music, food, and fun activities. At the bottom, it says "Sincerely, College of the Canyons". On the right side of the interface, a sidebar titled "Accessibility checker" is open. It shows three items with yellow warning icons: "Text contrast" (WCAG 2.0 AA 14.3) with 2 issues, "Semantic links" (WCAG 2.0 A 1.3.1) with 1 issue, and "Missing title" (WCAG 2.0 A 2.4.2) with 1 issue. There are dropdown menus for "Automated" and "WCAG 2.1 AA".

### Pros

- Easy to use and simple menu.
- Lets you check things like contrast, alt text, and headings.
- Shows accessibility problems clearly.
- Good for beginners.

### Cons

- Not as detailed as Axe.
- Some features require a login or paid version.
- It can miss some problems.
- Sometimes it focuses more on website design than email Html.
